Work in Progress

Market- versus Tax-Based Information: Effects on Gas-Bill Expectations and Demand for Residential Energy Efficiency · (with [Gilles Grandjean](#))
A randomized information experiment tests whether households respond differently to the same expected increase in gas bills when it is attributed to taxes rather than market forces. An instrumental-variable approach uses randomized information treatments to estimate the causal effect of gas-bill expectations on preferences for residential energy efficiency and renovation intentions.

Cheaper Heating or Protection from Price Spikes: What drives Heat Pump Adoption?
A randomized information experiment examines whether heat-pump adoption intentions respond more to lower expected heating costs or to reduced exposure to price spikes relative to gas heating. An instrumental-variable approach uses randomized information treatments to estimate the causal effects of these two belief channels on heat-pump adoption intentions.
